MMXM practice worksheet

Freeze the map before revealing the later candles.

Five references, one declared version

1. Original consolidation: timeframe, high, low and wick/body convention.
2. Outward delivery: selected leg and intermediate price references.
3. HTF destination: exact area and its invalidation.
4. Reversal evidence: selected swing, close condition and decision time.
5. Return objective: exact boundary, obstacles and order expiry.

Constructed buy-model comparison

Original range 100-110; outward low 90. These are abstract price units, not recorded trades or instrument specifications.

Entry 94 / stop 89 / target 100

Risk 5; reward 6; gross reward-to-risk 1.2R.

Entry 94 / stop 89 / target 110

Risk 5; reward 16; gross reward-to-risk 3.2R.

Later entry 98 / same stop 89 / target 100

Risk 9; reward 2; gross reward-to-risk about 0.22R.

Later entry 98 / same stop 89 / target 110

Risk 9; reward 12; gross reward-to-risk about 1.33R.

A tighter stop needs its own structural reason. Convert distance into contract risk using the actual specification, size, fees and slippage assumption. A mirrored sell example uses entry 116, stop 121 and targets 110 or 100 for the same 1.2R or 3.2R geometry.

Decision-time record

Keep candidates, missed fills and losses in the same chronological sample.

Date / symbol / feed / session / timezone: _____

Context timeframe / entry timeframe / policy version: _____

Original range high-low / date marked: _____

Destination / arrival time / invalidation: _____

Confirmation swing / close rule / actual decision time: _____

Entry area / order eligibility / expiry / fill time-price: _____

Stop / target / remaining distance / size / costs: _____

Planned management / maximum attempts / time exit: _____

Pre-decision screenshot / later screenshot: _____

Choose the observed path

[ ] Arrival, no confirmation: candidate; no eligible entry.

[ ] Confirmation, no retracement: planned entry never fills.

[ ] Entry fills, stop reached: preserve the losing result.

[ ] Entry fills, target reached: record planned target and net R.

[ ] Expired / unresolved / ambiguous: retain and explain.

Match the denominator to the question

Track mapped candidates, confirmations, fills and trade outcomes separately. An unfilled limit order is not a winning trade. If stop and target occur within one bar, use finer data or a conservative rule declared before testing.

Expectancy example: 40% wins x 2R minus 60% losses x 1R = 0.2R before costs not already included. Assumed inputs illustrate arithmetic, not an MMXM win-rate claim.
